# POSSIBLE VERY LARGE BASINS

# IRON + TITANIUM CONCENTRATIONS

# LUNAR ORIGIN AND EVOLUTION: STANDARD HYPOTHESIS - 1

- **GIANT IMPACT AT ~4.55 B.Y.**
  - **EARLY CORE FORMATION**
  - **HIGH ANGULAR MOMENTUM**
  - **GEOCHEMICAL ANOMALIES PROVIDED BY IMPACTOR**
- **MAGMA OCEAN FOR <50 M.Y.**
  - **OLIVINE-PYROXENE DOMINATED MANTLE**
  - **CA-RICH PLAGIOCLASE CRUST (~65KM THICK)**
  - **ILMENITE-RICH CUMULATES SANK TO MANTLE BASE**
  - **URKREEP RESIDUAL LIQUID AT BASE OF CRUST**
    - **ASYMETRICALLY BENEATH IMBRIUM REGION**

# **ORIGIN OF THE MOON**

## **LUNAR CONSTRAINTS**

- **OLDEST LUNAR ROCKS CRYSTALLIZED FROM SILICATE MELTS BETWEEN 4.5 AND 4.6 BILLION YEARS AGO.**
- **ELEMENTS OF THE ATOMIC NUMBER OF SODIUM (22) OR LESS ARE DEPLETED IN SAMPLES OF THE MOON'S CRUST AND MANTLE**
- **THE MOON BEGAN WITH A GLOBAL SILICATE MAGMA OCEAN ABOUT 500 KM DEEP**
- **THERE IS EVIDENCE OF UNDIFFERENTIATED CHONDRITIC MATERIAL BELOW ABOUT 500 KM**
- **Hf/W SYSTEMATICS INDICATE THAT CRYSTALLIZATION OF THE MAGMA OCEAN WAS LARGELY COMPLETE ABOUT 50 MILLION YEARS AFTER THE SOLAR NEBULA FORMED**
- **AT LEAST 45 LARGE IMPACTS OCCURRED ON THE MOON IN ITS FIRST 600 MILLION YEARS AND SOME WOULD HAVE AFFECTED ANGULAR MOMENTUM AND ROTATIONAL AXIS ORIENTATION**

# **ORIGIN OF THE MOON**

## **EARTH/MOON CONSTRAINTS**

- **RATIOS OF OXYGEN ISOTOPES IN THE EARTH AND THE MOON ARE THE SAME**
- **THE DENSITY OF THE EARTH IS 5.5 G/CM<sup>3</sup> AND OF THE MOON IS 3.3 G/CM<sup>3</sup>**
- **THE MOON IS ~12% IRON WHILE THE EARTH'S MANTLE IS ~8%**
- **THE MANTLES OF THE EARTH AND THE MOON HAVE DISTINCTLY DIFFERENT SIDEROPHILE ELEMENT SIGNATURES**
- **REFRACTORY ELEMENT CONCENTRATIONS ARE HIGHER IN THE MOON THAN IN THE EARTH, HOWEVER, THEIR RATIOS ARE THE SAME**
- **THE MOON AND THE EARTH HAVE DISTINCT DIFFERENCES IN VARIOUS OTHER ISOTOPIC RATIOS**
- **ANGULAR MOMENTUM OF THE EARTH-MOON SYSTEM IS HIGHER THAN ANY KNOWN PLANET-SATELLITE SYSTEMS**

# **ORIGIN OF THE MOON**

## **OLD HYPOTHESES**

- **SIMULTANEOUS FORMATION AS A DOUBLE PLANET SYSTEM**
  - **PROBLEM WITH ANGULAR MOMENTUM AND DIFFERENCES IN DENSITIES AND COMPOSITIONS**
- **BREAK-UP OR FISSION FROM A RAPIDLY SPINNING EARTH**
  - **PROBLEM WITH TOO MUCH ANGULAR MOMENTUM AND DISTINCT COMPOSITIONAL DIFFERENCES**
- **DISINTEGRATION OF NEAR-EARTH CROSSING PLANETESIMALS**
  - **PROBLEM IN MODELING THIS HYPOTHESIS**
- **CAPTURE OF AN INDEPENDENTLY EVOLVED PLANET**
  - **STILL UNDER CONSIDERATION**

# **ORIGIN OF THE MOON**

## **NEW HYPOTHESES**

- **EARTH IMPACT OF A MARS-SIZED PLANETESIMAL**
  - **Mars-sized planetesimal impacted a young Earth after separation of their iron-rich cores, i.e., impact assisted capture of the impactor's mantle.**
- **AGGREGATION OF CIRCUMTERRESTRIAL DISK**
  - **(NO EVALUATION AS YET)**

# **ORIGIN OF THE MOON**

## **EVIDENCE FOR EARTH IMPACTOR**

- **COMPUTER MODELS APPEAR TO PRODUCE A MOON WITHIN FEW MILLION YEARS**
- **CAN ACCOUNT FOR THE HIGH ANGULAR MOMENTUM OF EARTH-MOON SYSTEM**
- **CAN ACCOUNT FOR THE MOON'S OUT-OF-ECLIPITIC ORBIT AND NON-PARALLEL ROTATIONAL AXIS**
- **CAN GIVE A MAGMA OCEAN**
- **CAN ACCOUNT FOR THE MOON'S TOTAL IRON DEPLETION OVER CHONDRITES AND THE EARTH (PROVIDED THAT LESS THAN 10% OF EARTH'S MANTLE IS INCLUDED)**
- **CAN ACCOUNT FOR COMPOSITIONAL DIFFERENCES BETWEEN THE EARTH AND THE MOON BY DIFFERENCES BETWEEN THE EARTH AND THE IMPACTOR**
- **MAY ACCOUNT FOR THE LOSSES IN ELEMENTS BELOW THE ATOMIC NUMBER OF 23 IN THE MOON'S CRUST AND UPPER MANTLE**

# **ORIGIN OF THE MOON**

## **PROBLEMS WITH EARTH IMPACTOR**

- **MAY REQUIRE THAT THE ENTIRE MOON BE INITIALLY MOLTEN**
- **REQUIRES THAN THE ENTIRE MOON BE ACCRETED FROM DEVOLATILIZED MATERIAL, I.E., DOES NOT ACCOUNT FOR THE GEOCHEMISTRY OF MOON'S LOWER MANTLE**

# **ORIGIN OF THE MOON**

## **EVIDENCE FOR CAPTURE**

- **EARTH CAPTURE HYPOTHESIS:**
  - **The Moon and the Earth formed as independent planets in the same part of the solar system with the Moon being captured by the Earth prior to at least 2.5 billion years ago, the age of the oldest evidence of tidal interaction.**
- **EVIDENCE**
  - **MOON'S LOWER MANTLE PARTIALLY CHONDRITIC**
  - **CAN ACCOUNT FOR COMPOSITIONAL DIFFERENCES BETWEEN THE EARTH AND THE MOON BY DIFFERENT GRAVITATIONAL EFFECTS DURING PRIMARY ACCRETION**

# **ORIGIN OF THE MOON**

## **PROBLEMS FOR CAPTURE**

- **NO MODERN MODELING STUDIES OF CAPTURE**
- **ACCOUNTS FOR THE HIGH ANGULAR MOMENTUM OF EARTH-MOON SYSTEM ONLY BY THE ASSIMILATION SEVERAL LARGE IMPACTORS AFTER CAPTURE**
- **ACCOUNTS FOR THE MOON'S OUT-OF-ECLIPITIC ORBIT AND NON-PARALLEL ROTATIONAL AXIS ONLY BY THE CUMMULATIVE EFFECT OF MANY LARGE IMPACTORS**
- **ACCOUNTS FOR THE MOON'S TOTAL IRON DEPLETION OVER CHONDRITES AND THE EARTH ONLY BY BEING NON-COMPETITIVE WITH THE ACCRETION OF A MORE MASSIVE, CO-ORBITING EARTH**
